

## **Stream of packets:**

- There is a maximum size limit for the packet to be transmitted over the network.
- For Ethernet (the most common network technology), it is 1500 bytes.
  - 1460 Bytes of data payload + 20 Bytes of TCP header + 20 Bytes of IP header.
- A TCP packet can take only 1460 Bytes of data as a payload over Ethernet network. Therefore, the communication typically requires exchange of multiple packets between the source and the destination

- The payload to be transmitted is broken into smaller pieces to keep the packet size within limits. For example, to send a picture of 4 MB i.e. 4096 bytes, the picture will be segmented into smaller pieces and it will take more than one packet to send the picture.
- For an investigator it is important to capture multiple packets in order to make complete sense of the content being sent or received over the network.

## Packet Capturing Tools:

**Wireshark:** [www.wireshark.org](http://www.wireshark.org)

- The information being sent or transmitted over the network could be captured by the tools called packet sniffing or capturing tools.
- One of the most popular packet capturing tools is **Wireshark**. It can capture packets that are sent or received by the device.
- It can also analyse the packets captured by any other tool.

**NetworkMiner** <http://www.netresec.com/?page=NetworkMiner>

- Network Forensic Analysis Tool for Windows
- Can be used as a passive network sniffer/packet capturing tool in order to detect operating systems, sessions, hostnames, open ports etc.

## **Wireshark Features:**

- Devices may run multiple network dependent applications or services simultaneously. Therefore, A large number of packets are captured in a few seconds, which makes filtering very important for the investigator.
- Wireshark Display Filters show the packets of interest and hide all other packets for convenience.
- Wireshark lets you reassemble the data exchanged during a specific communication.
- One of the easiest way is to select the packet of interest, right click and select follow > TCP Stream.
  - This option will extract information and reassemble the data from selected stream.

## TCP Stream

The image shows the Wireshark network protocol analyzer interface. The main window displays a packet capture from 'rhino2.log'. The packet list pane shows six packets, with the first packet (No. 1) selected. This packet is a TCP SYN packet from 137.30.123.234 to 64.233.167.104, port 2024. The packet details pane shows the structure of the packet: Ethernet II, Internet Protocol Version 4, and Transmission Control Protocol. The packet bytes pane shows the raw data in hexadecimal and ASCII. A right-click context menu is open over the selected packet, showing various actions. The 'Follow' option is selected, and a submenu is displayed with 'TCP Stream' highlighted.

No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000	137.30.123.234	64.233.167.104	TCP	62	2024 → 80 [SYN] Seq=0 Win=64240 Len=0 MSS=1
